Abstract

This report contains Lecture Notes for the distributed Network Protocols course that I have been teaching at the Technion in the last few years. The course is given at the senior-undergraduate/first-year graduate level. Its pre-requisite is an introductory course in Computer Networking.

Most of the presented material is in reasonable form, but some parts are still in preliminary stages. This is the case in particular with t he Minimum Spanning tree and the Session Management chapters. I will periodically update by website home page http://www.comnet.technion.ac.il/segall/Reports.html with updated versions.
